

BRACKET 1: AI-on-DPI

AI applications built on top of existing DPI rails — using identity, payments, commerce, and credential infrastructure as foundational layers.

Project 1: Agentic AI Procurement Agent on Beckn Protocol

Category: AI-on-DPI | Bracket: Bracket 1

Project Overview

Build an autonomous AI agent that can discover, compare, negotiate, and place orders on the Beckn open commerce network — specifically targeting enterprise procurement workflows. Think of it as an AI purchasing assistant that operates natively on open networks instead of locked-in marketplace platforms.

Large enterprises spend millions on procurement. Most of it runs through SAP Ariba or Coupa — closed platforms with hefty licensing fees. Beckn protocol opens up commerce as a network layer. An AI agent that can autonomously source, compare, and transact on this open layer gives enterprises a genuine alternative. This isn't theoretical — ONDC (built on Beckn) is already live in India with 500K+ sellers.

The DPG at the core is Beckn Protocol, with the related ONDC (Open Network for Digital Commerce) network. The project produces a multi-step agentic system that takes a natural language procurement request, translates it into Beckn-compliant API calls, discovers sellers across the open network, compares offers, negotiates terms, places orders, and maintains a full procurement audit trail for enterprise compliance.

DPG: Beckn Protocol (github.com/beckn/protocol-specifications) Network: ONDC (Open Network for Digital Commerce)

Technical Approach — What to Build

- Natural language parser that converts procurement requests into structured intent (item, quantity, location, budget, timeline)
- Beckn Application Platform (BAP) client implementing /search, /select, /init, /confirm, and /status flows
- AI comparison engine scoring sellers on price, delivery, rating, and compliance with explainable reasoning
- Negotiation capability using Beckn's /select with modified terms, with configurable strategy policies
- Enterprise procurement dashboard with approval workflows, real-time tracking, and audit trails
- Multi-network search — querying multiple Beckn-compatible networks simultaneously
- Agent memory — learning from past procurement patterns to improve recommendations

Team Composition

Intern	Role	Focus Area
Intern 1	Beckn Integration Engineer	Protocol adapter, API integration, Beckn sandbox setup
Intern 2	AI Agent Developer	LLM orchestration, agent reasoning, multi-step planning
Intern 3	Enterprise UX & Compliance	Dashboard, audit trails, approval workflows

Definition of Done

A working prototype where a user types a procurement request in plain English, the AI agent autonomously discovers sellers on Beckn/ONDC sandbox, compares offers, explains its reasoning, and (with approval) places an order — all visible through a clean dashboard with full audit trail.
